

Flue Gas too hot?

Spending money to buy fuel that in turn heats the outdoors is really hard to swallow.

The graph shows how considerable efficiency is lost by having the stack temperature too high. We provide products and engineering services that can drastically increase boiler efficiency. One such product is a boiler economizer.

The concept is incredibly simple: pump boiler feed water through a heat exchanger and cool the stack gasses.

Economizers can be supplied for any fuel and in a wide variety of sizes.

The return on investment is normally quite high. But it can be quite negative as well if the unit is installed improperly. We know exactly how to ruin an economizer and the simple steps to take on proper installation to prevent the problem.
